

1 ABSTRACT

2 The instant invention involves the use of a
3 combination of preparatory steps in conjunction with mass
4 spectroscopy and time-of-flight detection procedures to
5 maximize the diversity of biopolymers which are verifiable
6 within a particular sample. The cohort of biopolymers
7 verified within such a sample is then viewed with
8 reference to their ability to evidence at least one
9 particular disease state; thereby enabling a diagnostician
10 to gain the ability to characterize either the presence or
11 absence of said at least one disease state relative to
12 recognition of the presence and/or the absence of said
13 biopolymer, predict disease risk assessment, and develop
14 therapeutic avenues against said disease.
